This site gives a new arrangement of the 64 hexagrams of the I Ching. The new arrangement lets us describe the natural group of transformations of these hexagrams in a simple way.

Sacred geometry ascribes symbolic and sacred meanings to certain geometric shapes and certain geometric proportions. It is associated with the belief that a god is the geometer of the world. The geometry used in the design and construction of religious structures such as churches, temples, mosques, religious monuments, altars, and tabernacles has sometimes been considered sacred.

The word "fractal" often has different connotations for laymen as opposed to mathematicians, where the layman is more likely to be familiar with fractal art than the mathematical concept. The mathematical concept is difficult to define formally, even for mathematicians, but key features can be understood with little mathematical background.

The phenomenon of Flappy Bird ushered a new genre into the gaming world - bloody difficult and infuriating games. Supposedly Geometry Dash can be added to this genre as well, if it wasn't for one little detail: it's not stuck in the infinite loop of desperation and madness.

A characteristic of applying these transformations is that the order is important. If the rotation matrices above are called  $R_x(t)$ ,  $R_y(t)$ , and  $R_z(t)$  respectively then applying the rotations in the order  $R_z(t) R_x(t) R_y(t)$  will in general result in a different result to another order, say  $R_x(t) R_y(t) R_z(t)$ . In what follows a particular order will be discussed and the other ...

Sacred geometry is an ancient art and science which reveals the nature of our relationship to the

cosmos. Its study unfolds the principle of oneness underlying all creation in its myriad expression, and leads us inevitably to the perspective of interconnectedness, inseparability and union.

1. Introduction. This paper takes a critical look at existing fold-thrust models and interpretation strategies in fold and thrust belts. Our premise is that the tendency to use a narrow range of idealized "structural styles" for the relationships between folds and thrusts is an important source of interpretational bias that can impede understanding of structural geometry.

Actually, there are an infinite number of locations that satisfy this condition. If you stood anywhere 50 miles north of the latitudinal (idk if this is a word) circle 50 miles in circumference, you would travel 50 miles south, then 50 miles west around the earth to end up where you just were, then 50 miles north to end up at your starting position.
