The last ten years have seen the discovery of amorphous metal alloys that are glass forming at cooling rates as slow as  $1^{\circ}\text{C s}^{-1}$  to  $100^{\circ}\text{C s}^{-1}$  in the bulk via conventional metal processing such as casting, but with the ease of molding of polymers. They are twice as strong as steel, have greater wear and corrosion resistance, are tougher than ceramics, and yet have greater elasticity.

Liquid crystals (LCs) are a state of matter which has properties between those of conventional liquids and those of solid crystals. For instance, a liquid crystal may flow like a liquid, but its molecules may be oriented in a crystal-like way. There are many different types of liquid-crystal phases, which can be distinguished by their different optical properties (such as textures).

We present scanning tunneling microscopy and spectroscopy measurements on a cleaved surface of the  $\text{LaO}_{0.9}\text{F}_{0.1}\text{BiSe}_2$  single crystals. Tunneling spectra show a finite local density of states at E F, which is consistent with metallic conductivity in bulk. In addition, the existence of the supermodulation running along the diagonal directions of Bi square lattice was revealed.

A nanocrystal is a material particle having at least one dimension smaller than 100 nanometres, based on quantum dots (a nanoparticle) and composed of atoms in either a single-or poly-crystalline arrangement.. The size of nanocrystals distinguishes them from larger crystals.For example, silicon nanocrystals can provide efficient light emission while bulk silicon does not and may be used for ...

Home Up Quartz Crystal Technology Oscillator Technology MCF Technology Manufacturing: Basic Technology of Quartz Crystal Resonators. Quartz crystal resonators (often called "crystals") are widely used in frequency control applications because of their unequalled combination of high Q, stability, small size and low cost.

Ocean. Seaborne trade accounts for about 90% of the global trade, and as per UNCTAD, 1687 million tons (2015 estimate) were carried in around 177.6 million containers (2015 estimate) covering 998 billion ton-miles (2016 estimate).. Because of size or volume, there are several types of cargoes that cannot be or is economically unviable to move by other modes of transport than the sea.
