Glassy/Amorphous Metals. Glassy/amorphous metal is a metallic material with a disordered atomic scale structure (Figure 27.2). It is characterized by a limited number of diffuse halos in x-ray, electron, and neutron diffraction, and no sharp diffraction contrast in high-resolution electron microscopy.

Amorphous metal. More recently a number of alloys with critical cooling rates low enough to allow formation of amorphous structure in thick layers (over 1 millimeter) have been produced; these are

known as bulk metallic glasses ( BMG ). More recently, batches of amorphous steel with three times the strength of conventional steel alloys have been produced.

### **Bulk metallic glasses an overview (eBook, 2008) [WorldCat.org]**

Metallic glasses or amorphous metals are novel engineering alloys in which the structure is not crystalline (as it is in most metals) but rather is disordered, with the atoms occupying more-or-less random positions in the structure. In this sense, metallic glasses are similar to the more familiar oxide glasses such as the soda-lime glasses used for windows and bottles.
