Reviews of Newton's Principia: The Central Argument

Sir Isaac Newton (1642-1727) was a demigod mathematician, physicist, mystic, alchemist and philosopher. Credited with revolutionary advances in classical mechanics, optics, and mathematics, he is rated as one of the most important and influential individuals in the history of science and mathematics.

Newton's derivation begins with a particle moving under an arbitrary central force $F_1(r)$; the motion of this particle under this force is described by its radius $r(t)$ from the center as a function of time, and also its angle $\theta_1(t)$.

Newton's theorem of revolving orbits - Wikipedia

Though the Principia is deliberately divided into mathematical (Books I and II) and physical (Book III) portions, Newton clearly views this quasi-causal conception of mathematics as central to his method in deriving universal gravity in Book III.

Newton clearly intended the work to be viewed in this way when in 1686 he changed its title to *Philosophiae Naturalis Principia Mathematica*, in allusion to Descartes's most prominent work at the time, *Principia Philosophiae*. (The title page of Newton's first edition underscored this allusion by placing the first and third words of the title in ...

In the Principia, Newton proposed that the same relations apply also to the motion of the satellites around a planet. According to his principle of universal gravitation, a is proportional to the mass M of the center of force, and therefore $a = GM/r^2$, where G is a universal constant, now called Newton's constant.
