Examples. One of the most common examples of an algebraic data type is the singly linked list. A list type is a sum type with two variants, Nil for an empty list and Cons x xs for the combination of a new element x with a list xs to create a new list. Here is an example of how a singly linked list would be declared in Haskell:

How to Simplify Algebraic Expressions. Learning how to simplify algebraic expressions is a key part of mastering basic algebra and an extremely valuable tool for all mathematicians to have under their belt. Simplification allows a mathematician to change a complex, long, and/or awkward expression into a simpler or...

where the s are integers (or equivalently, rational numbers) and satisfies no similar equation of degree , then is said to be an algebraic number of degree .. A number that is not algebraic is said to be transcendental.If is an algebraic number and , then it is called an algebraic integer.. In general, algebraic numbers are complex, but they may also be real.

Algebraic Number -- from Wolfram MathWorld

In mathematics, an algebraic expression is an expression built up from integer constants, variables, and the algebraic operations (addition, subtraction, multiplication, division and exponentiation by an exponent that is a rational number). For example, $3x\,2 - 2xy + c$ is an algebraic expression. Since taking the square root is the same as raising to the power $1/2$,
